

PRD — Fleek University & Help Center Manager (FleekOS Tool Registration)

Summary

We are replacing the Zendesk seller help center with **Fleek University** — an in-product, mobile-first help and learning portal for sellers — powered by the **Help Center Manager**, a Notion-style content tool on FleekOS that gives the Seller Experience team full ownership of content, structure, and publishing with zero engineering involvement. We expect this to deflect a meaningful share of Information tickets (76% of all seller tickets) and directly support the Supplier NPS +30 program.

Team

Role	Name
PM	Syed Faez Hasan (Seller Experience)
Designer	TBD — icon set & mascot ad-hoc; design system defined (SOP Portal language + anti-generic guardrails)
Engineers	Built by Faez (Claude-assisted); platform review owner TBD — needs assignment before FleekOS registration

Context

Fleek's seller base is PK-heavy, mobile-first, and frequently Urdu-first. Seller help content lives today on an external Zendesk site — desktop-shaped, English-only, organized by internal team names, and invisible from the vendor app where sellers actually work. The SX baseline (Jan–Apr 2026) shows 76% of seller tickets are Information questions — agents repeatedly answering things documentation should handle. The Supplier NPS program (+1 → +30 in two quarters) names self-service quality as a key driver. Daraz University proves the education-portal pattern works for exactly this seller demographic (160k monthly users). All 26 Zendesk "For Sellers" articles have already been migrated into the new tool via Zendesk's API; the tool, storage, and seller experience are built and verified on localhost with production infrastructure (Vercel Blob) live.

Problem

Sellers cannot solve routine questions themselves at the moment they hit them, so they open tickets instead — 76% of all seller tickets are Information requests, consuming SX agent capacity and slowing sellers' operations.

Hypothesis: Help content exists but is functionally invisible (external site, separate from the vendor app) and hard to consume for our seller base (long English text pages, no visual/video-first format, org-chart structure instead of seller jobs). Sellers default to the channel that works: asking a human.

Evidence this is real and worth solving:

- How many users affected: all active sellers (every seller contacting support; exact MAU available from fleek_analytics.growth_model — **to attach before review**)
- Severity (1-10): 8 for payment/order-blocking questions (seller cannot operate until answered); 4–5 for general how-to questions
- 76% of seller tickets are Information type (SX ticket-mix baseline, Jan–Apr 2026)
- Zendesk gives no search/failed-search/effectiveness analytics, so content gaps are invisible today

- Buyer-side precedent: buyer ticket taxonomy showed concentrated, deflectable question clusters (Buyer Help Center Phase 1, approved Jun 2026)

Impact

Business impact

Agent hours: the majority ticket category (Information, 76%) becomes deflectable, freeing SX capacity without headcount

Supplier NPS program: self-service is a named driver of the +30 target

SX gains content analytics (searches, failed searches, helpful-%) — a permanent feedback loop for what to write next

Customer impact

Sellers get answers 24/7 inside the app, in plain language with steps, screenshots and video — no waiting for an agent

Payment/order-blocking questions (highest severity) resolve at the moment of need

Urdu support (roadmap) makes help genuinely accessible to the core seller base

Solution

Two surfaces, one content system:

1. **Fleek University (seller-facing, /university)** — mobile-first portal patterned on Daraz University in Fleek's brand: home with search and six job-based topics (Start Selling, List Products, Ship Orders, Get Paid, Fix a Problem, Grow), block-rendered articles (summary card first, numbered steps with screenshots, silent-demo autoplay videos, tables, collapsible FAQs, embedded PDFs), topic pages, updates feed, and a help sheet suggesting articles before chat/WhatsApp escalation. Course/lesson/quiz UI is built but gated off until real lesson content exists.

2. **Help Center Manager (internal, /tools/help-center)** — Notion-style authoring: rich-text blocks with slash-menu, tables, dividers, image/video/PDF upload (all embedded), drafts/publish/schedule/archive, preview-as-seller, paste-an-SOP importer, media library, announcements, and export/import backup. Access rides on FleekOS's existing role system (AdminProtectedRoute; owner/admin full control, editor tier without destructive actions).

Architecture: typed JSON content blocks stored on Vercel Blob via two consolidated serverless functions (public reads serve published-only content, cached; writes require admin JWT); media uploads go browser-direct to Blob/CDN (15MB videos bypass function limits); the manager is local-first with automatic debounced sync, server-wins on boot. Storage sits behind a single interface for a later Supabase migration with zero UI change.

Roll out plan

Stage	When	What
Production deploy	Mon 13 Jul	vercel deploy --prod → seller-finance-management.vercel.app (or joinfleek.com subdomain); admin login smoke test
Content publish	13–14 Jul	SX polish pass on the 25 migrated drafts (rename to plain language, In-short cards, strip Zendesk cruft) → publish

Stage	When	What
Cutover	Thu 16 Jul	Seller announcement (in-app + WhatsApp), agents switch to new links, Zendesk For-Sellers section stubbed to redirect
Vendor-app embed	Sep–Oct	Webview + SSO in the vendor app (release-train dependency)
Deflection integration	Oct	Help sheet wired into the real contact flow; deflection metric goes live
University layer + Urdu wave 1	Nov	Real course content, progress, quiz/badges; top-10 articles in Urdu

Success metrics

Primary metric

Information-ticket volume per active seller: **–30% by cutover + 90 days** (source: `fleek_hub.cx_dashboard_base`)

Secondary metric

Help adoption $\geq 40\%$ of active sellers opening Fleek University monthly; article helpful-rate (thumbs-up share) $\geq 80\%$ weighted by views

Balancing metric(s)

Chat accessibility must not degrade — contact path stays ≤ 1 tap deeper than today; watch seller CSAT/complaints about "can't reach support" during ramp. Failed-search rate $\leq 15\%$ (watched so self-serve isn't a dead end)

Known limitations

- Until the vendor-app embed ships, sellers access via web link with vendor login (no native entry point)
- Migrated images are still Zendesk-hosted (`src` URLs) until re-uploaded to our media library during polish
- English-only at launch; Urdu is per-block-ready in the data model but untranslated
- Analytics event capture (views, searches, feedback → BigQuery) is designed but **not yet wired** — at launch, effectiveness is qualitative; instrumentation lands with the Oct deflection phase
- Inline PDF rendering varies by mobile browser (an "Open full PDF" fallback always shows)
- Rich-text internals use browser-native editing commands (deprecated but universal); planned swap to TipTap without changing stored content
- Vercel Hobby plan: 12-function cap (currently at 11) and no team seats — plan upgrade needed when a second engineer joins

Risks

- **Content polish capacity (highest):** 25 drafts must be publish-quality by Jul 14; mitigations — importer already did the structural work, ~15 min/article, fallback is launching with the top subset covering most ticket volume
- **Single-builder bus factor:** one person built and operates this; mitigation — architecture notes in repo docs, standard Vercel primitives, platform review owner to be assigned at registration

- **Deflection unmeasurable at launch:** the primary metric reads from ticket volume trends until contact-flow instrumentation ships in Oct; interim measurement is directional
- **Concurrent editing:** last-write-wins per content document; two admins editing the same article simultaneously can overwrite each other (acceptable at 2–4 editors; row-level merge comes with Supabase)
- **Domain/brand:** launching on a vercel.app URL if a joinfleek.com subdomain isn't assigned by Monday

Out of scope

Buyer help center (stays on Zendesk) - public/SEO site (app-only by decision) - approval workflows and audit logs (2–4 editors) - certificates/webinars (2027) - AI answers/chatbot - per-seller personalization beyond the existing conditions engine.

Milestones

Milestone	Date
Build complete: portal, editor, storage, auth, 26 articles migrated	10 Jul 2026 [done]
Production deploy	13 Jul 2026
All content published (polish pass done)	14 Jul 2026
Cutover from Zendesk	16 Jul 2026
Vendor-app embed	Sep–Oct 2026
Deflection metric live	23 Oct 2026
University layer + Urdu wave 1	27 Nov 2026
90-day metrics review	late Jan 2027

Helpful resources

- Engineering PRD: `SELLER_UNIVERSITY_PRD.md` (repo root) - Stakeholder narrative: `FLEEK_UNIVERSITY_PRD_NOTION.md`
- Wireframes v3 (design system + guardrails): `claude.ai/code` artifact "Seller University"
- Code: `src/components/university/` (both surfaces), `api/help-center/`, `api/_lib/help-center/`
- Old help center: `support.joinfleek.com` → For Sellers (26 articles, migrated 10 Jul via public API)
- Pattern reference: `university.daraz.pk` - Internal design language: FleekOS SOP Portal
- Data sources for metrics: `fleek_hub.cx_dashboard_base` (tickets), `fleek_analytics.growth_model` (active sellers)
